List of known bugs

- When ordering by distance, when there is an event in less than 1km (ex. 400m), it's ordered as if it was in km (ex. 400m is handled as 400km for the ordering)
- Without an internet connection the app is literally unusable.
- The log in does not work for all of us, we assume it is due to the fact that it is still in developer mode and not published to the play store yet. The result is that some of us that are not registered with a key cannot login with Google.
- When a host profile is opened there is no picture and the pasta one appears
- The phone number is never saved inside an event even if it is asked at the creation. So when you open a host from an event, the number shown is the one related to the host (which can be different from the one inserted in the new event form)
- The My Profile is empty at the moment, just shows the field categories
- The additional pictures can be added only once the event is created, not in the creation page
- The pictures cannot be seen larger or full screen as their definition is very low because of the compression and the fact that they are not saved in a larger version
- There is no form of authentication for hosts (and users), they are signed in with the Google email, but then they can post for any actual host, or lie on their info, they can also change their info completely (ex. from Five Guys to UCSC), but then all of their past events are linked to the new profile. You can also change your info when adding an event.
- Logout doesn't work: when logging out, you don't have the possibility to log in with a different Google account, you can only click on the button and log with the same account you used previously.
- When clicking on a Host, no events show up under Events.
- While creating an event then clicking on 'delete', the application crashes.
- An event has no 'category' listed under its description. It just shows Category.
- User or host can be participant of any event but number of participants will not change unless you close and open the app.
- The end date is not shown in the events.
- When bookmarking an event, it appears two times in the saved events list.
- When searching for a keyword, the result appears two times in the results list.
- Sometimes there are issues in saving events, some of them will never appear even if they are inside the radius as they are not posted in the geoFire database.
- The sorting criteria is not highlighted in the sorting dialog.
